Goat Milk Shaving Soap

After Years of testing . . .

. . . and more testing, our Goat Milk Shave soap is here! Our artisan handmade shaving soap has been designed especially for that wet shaving man (or woman).

Why so good?

Our Shave Soap is designed to have a thick and hearty lather from coconut, while the goat milk protects the skin and softens the beard, providing an extremely close shave. An awesome postshave is from castor oil together with the goat milk. The Kaolin clay gives a slickness that also adds a cushion on your face (or legs for women!) so that you barely feel the blade.

If that's not enough, the shaving aficionados will be happy to know that the lather offers sharp peaks, and the sheen in the soap lather proves good water suspension. Be assured that there is no propane, no alcohol, and no butane!

INGREDIENTS: Goat Milk, Beef Tallow, Steric Acid, Coconut Oil, Shea Butter, Kokum Butter, Potassium Hydroxide, Sodium Hydroxide, Castor Oil, Fragrance Oil, Glycerin & Kaolin Clay.

Natural Deodorant for him!

Take care of the man in your life by giving him the BEST: the best way to smell great in a NATURAL way.

We use raw Shea Butter and Coconut Oil for the soothing qualities, and Baking Soda and fragrance for your new splendid essence! If your man has a sensitivity to essential or fragrant oils we now carry an unscented deodorant.

Why go natural with your deodorant? Most conventional deodorants contain these toxic ingredients: aluminum chlorohydrate, parabens, propylene glycol and triclosan. Here's what studies have shown concerning these hazardous substances:

Aluminum exposure has also been linked to problems with the liver, kidneys and the brain.

Parabens mimic the activity of estrogen in the body's cells and is found in most mastectomy tissue samples.

Propylene Glycol is considered a neurotoxin and is known to cause contact dermatitis and liver and kidney damage.

Triclosan is an endocrine disrupter and a suspected carcinogen. It is also lipophilic, meaning that it gets stored in your fat for long periods of time. The Scientific American reported that triclosan is now detectable in human breast milk, blood, and urine samples.
